QUALITY AMMUNITION

The development of modern small arms ammunition is inseparably linked with the history of The Peters Cartridge Company. From the date of its founding in 1887 it has constantly and consistently sought better processes, better materials and perfected workmanship, and through the successful combination of the efforts in these directions, it has inevitably resulted in the  brand being unrivaled today in the ammunition World.

The early years of the Company's existence were marked by many vicissitudes, but the history of the business has been a record of constant growth and improvement, obstacles met and surmounted and triumphs achieved, so that today the Company is an acknowledged leader in the industry and its product regarded by the trade and the consuming public as the *World's Standard*.

During the Great World War The Peters Cartridge Company completed all contracts with foreign Governments who were later our Allies, and when the United States entered the mighty conflict all the resources, facilities and energy of the Company were turned over to our Government: and how well it served is fully evidenced by a certificate of "Distinguished Service" presented to this Company by the United States Government, signed by the Secretary of War.

With the signing of the Armistice, which brought to an end War operations, thoughts again turned toward domestic requirements and The Peters Cartridge Company not only resumed the manufacturing of goods for domestic consumption in a remarkably short time, but produced in quality a totally superior product to anything ever before placed in the hands of the shooting public.

The main plant of The Peters Cartridge Company consists of several massive, steel reinforced, fireproof buildings, constructed within the last nine years, which were specifically designed and laid out for the manufacture of highest quality small arms ammunition, with full consideration given to economical production of same.

WORKS OF THE PETER CARTRIDGE COMPANY LOCATED AT KINGS MILLS, OHIO

The Peters Cartridge Company employs the highest type of workmen, most of whom are residents of the model village of Kings Mills, Ohio. Their happy and contented disposition is the result of the very pleasant home life enjoyed by all, made possible by the systematic manner in which the village is operated. Rents are cheap, with ample ground for home gardening. Inhabitants have unusual opportunities for recreation, including swimming and fishing in the picturesque Little Miami river, theatre, library, gun and rifle club, athletic sports, etc. In addition the village maintains a fine church. The big majority of these employees are enthusiastic shooters either in the field, at the traps, or on the range. Wherever producers are consumers it follows that more interest will be taken in the manufacture of that which is produced and that greater care will be exercised by each and every employee in the performance of his duties—for being entirely familiar with the consumer's requirements, he knows how very important it is that every operation in the making of a shell or cartridge be exactly as it should be to produce the desired results.

The education of the young folks is taken care of at a fine large school, both Elementary and High.

Such are the surroundings of those who work in the great factory of The Peters Cartridge Company. The high standard of home life enjoyed by each and every employee is bound to reflect itself in the work performed by these people. It is a well known axiom, that a good workman makes a good citizen, and vice-versa, and the fact that in the village there are no police of any kind indicates the high type of citizenry located

PETERS CARTRIDGE COMPANY

ABOUT TWENTY-FIVE MILES FROM CINCINNATI

there. The health of every employee is carefully guarded by a physician and trained nurses, in a modern and completely equipped hospital located at the factory. No employee can work for The Peters Cartridge Company who does not measure up to both mental and physical requirements.

The factory management in collaboration with the Purchasing Department provides for the various materials and the inspection and acceptance thereof. The materials for Peters metallic cartridges are copper and brass in sheets, from which the metallic shells are made; pig lead, tin, etc. for bullets; powder; and materials for priming mixtures. All bullets are made in accordance with Peters standards, in order to produce that best suited to the arm in which it is to be used. Many kinds of powders for the various cartridges manufactured are used but they must all measure up to established Peters requirements before they are accepted for loading. The powder suited to produce the best load is ascertained by scientific tests in the Ballistic Department. All ingredients that go to make up the different priming mixtures must be to Peters specifications.

Materials for loaded paper shot shells are sheet brass and sheet gilding for the shell heads and primers, shell paper, wad paper, powder, hair for the famous Peters "felt wadding", lead, antimony, etc. for the shot. All of these materials are provided especially for The Peters Cartridge Company under its own formulae and specifications, but nevertheless all materials that enter into Peters products, when received at the factory are subjected to the most rigid tests by the Peters laboratories before they are accepted for use and issued into process.

A section of the large and modernly equipped chemical laboratory of the Peters plant.

The laboratory is fully provided with the latest and most efficient testing equipment for performing both chemical analysis and physical tests. The most important operations of the laboratory are:

1. Analysis and inspection of all raw materials.
2. Collaboration with the Purchasing and Manufacturing Departments in the matter of drawing up specifications for each lot of raw materials, so that the best possible quality may be obtained.
3. Inspection and analysis of materials in process from each factory operation, on both metallic and shot gun cartridges.
4. Analysis and testing of finished goods in cooperation with the Ballistic Department.

The Research Department of the Laboratory is required to be constantly on the look-out for any chance to introduce improvements in the quality of goods. Much time is devoted to this end of the work and when an improvement is possible, no expense is spared and no unnecessary delay occasioned in adopting it.

Practically all important machines used in the production of Peters Ammunition were designed and built in our own Engineering Department.

CUPPING DEPARTMENT—Where the cups or shells for the various cartridges and shot shells are blanked from sheet metal. This is the first operation in the making of a shell or cartridge.

METALLIC CARTRIDGES

In dealing with metallic ammunition we have three main classifications, namely, Rim Fire, Center Fire Pistol and Revolver, Center Fire Military and Sporting cartridges.

In Metallic Cartridges, to fully and satisfactorily meet the demands of the trade a total of over 260 different sizes and styles of cartridges are manufactured, from the small .22 B. B. Cap to the large .45-90 cartridge.

RIM FIRE CARTRIDGES: Rim Fire shells are cupped from sheet gilding metal. (Gilding is an alloy of copper and zinc, high in copper, while brass is an alloy of zinc and copper containing less copper.) The cupping operation consists of blanking a disc and forming this into an open top cylinder or cup. After the cup is formed, it is annealed to soften the metal for the drawing operations. (A drawing operation is one in which the diameter of the piece and its side wall thickness are reduced and the metal thus displaced is carried into the length.)

The drawn shell is trimmed to length for the heading operation, which at the same time removes the uneven metal left after drawing.

Next comes the heading operation, which is the final mechanical operation before priming. The head of the shell, head thickness, size of primer cavity and final shell length are all controlled in this operation.

After washing thoroughly, the shells are delivered to the priming machines, where the mixture is placed in the cavity formed in the rim.

General view in the Metallic Department.

CENTER FIRE CARTRIDGES: Center Fire Shells consist of two main classes, reduced or "bottle necked" and straight. These are cupped from brass, trimmed and drawn in a manner similar to the Rim Fire shells. The heading operation is next, at which time the primer pocket is formed. After the straight shells are trimmed to the final length they are ready for the insertion of the primer.

The reduced or bottle necked shells, after heading, are annealed to soften the metal for the reducing or necking operation. This operation is controlled in the laboratory by microscopic examination of the structure of the metal. The reducing follows and is performed by a series of operations, bringing the neck of the shell to the proper shape and size. The shells are then trimmed to desired length and given a final neck anneal, an extremely important feature of the (P) line, which insures the proper temper to maintain the correct tension on the bullet and still not season crack. This is also controlled by the laboratory microscope.

Both classes of shells are now ready for the inserting of the primer, which operation is performed on presses especially designed for this purpose.

In the loading of Peters metallic cartridges, the correct charge of powder is deposited in the shell, the bullet inserted and then crimped into place. This is done on machines designed and built in our Engineering Department, which load accurate charges of powder, and which assure extreme accuracy, uniformity and velocity in every cartridge.

View in Ballistic Department, where the chronographs and other equipment for testing are installed. By means of the chronographs Peters Ammunition is being constantly tested for velocity and ignition time. Other equipment in this department tests for patterns, pressures, penetration, accuracy of bullets, etc.

Realizing the great importance to the shooter of having ammunition that never fails to do what is expected of it, even in the tightest pinch, The Peters Cartridge Company maintains at all times a very close check on all goods in process and all finished goods through constant testing and inspection. Peters Ballistic Department, under the direction of experts, has the latest and most modern equipment for conducting a full and complete test of every cartridge, from standpoint of ignition time, velocity, pressure, penetration, accuracy, primer testing, etc. This careful and constant checking to see that the finished goods at all times measure up to the high standard established by Peters makes possible ammunition which is absolutely dependable, and assures the user really superior results.

PETERS *AMMUNITION*

POWDERS LOADED IN PETERS METALLIC CARTRIDGES

SEMI-SMOKELESS POWDER

Those of Peters metallic cartridges that are loaded with KING'S SEMI-SMOKELESS powder, give their users a far superior load to anything otherwise obtainable, in fact, there is no powder that can successfully compete with Semi-Smokeless for cleanliness, accuracy and uniformity. On the range, it has established records which will probably stand for years, and it has given users cleaner, more accurate and uniform ammunition than can be secured with any other powder.

Semi-Smokeless has the velocity of Smokeless powder, with the low breach pressure of black powder. It is neither black nor smokeless, nor a combination of the two, but is an entirely different product and a vastly superior one.

As stated, not only does Semi-Smokeless give extremely accurate and uniform results, but it is known for its cleanliness and lack of injury to the rifle barrel. No rifle or gun should be set aside for any length of time after using, without having the barrel properly cleaned and oiled, but hundreds of rounds of Semi-Smokeless ammunition can be fired thru a gun barrel, without causing fouling or interfering to any extent with the accuracy, and in no way injuring the barrel.

The Peters Cartridge Company is the exclusive user of Semi-Smokeless powder, and in cartridges where others load ordinary black powder, Peters supplies Semi-Smokeless, and therefore gives shooters of the  brand superior ammunition at no increase in price. The statement is sometimes made with reference to other brands of ammunition that a powder is supplied which is just as good as Semi-Smokeless as loaded by Peters. *This* mere statement immediately standardizes Semi-Smokeless powder. It might be further stated that not one single grain of black powder is loaded behind a Peters bullet.

SMOKELESS POWDERS

Smokeless powders loaded in Peters metallic cartridges are standard American powders which we have found best adapted to give maximum life to the arm, combined with the highest velocity and ignition, consistent with pressures permissible in the various arms. We are absolutely free to, and do, take advantage of any improvement in powder, no matter by whom manufactured.

PETERS .22 SHORT CARTRIDGES

Semi-Smokeless

Smokeless

Especially adapted to Shooting Gallery use

We have given special attention toward producing a .22 Short Cartridge which would not only completely satisfy all commercial requirements including outdoor target practice, but which would give the greatest amount of satisfaction where used in shooting galleries. The gallery man requires a cartridge that is sure-fire, accurate, that will work perfectly in his rifles, and one that is clean shooting.

Peters .22 Short cartridges embody all of these important requisites to such a fine degree that it has been proven on more than one occasion that they are the most satisfactory gallery cartridges made. Galleries all over the country are coming more and more to 100% use of Peters cartridges. By producing a cartridge that fully meets every requirement of the shooting gallery it necessarily means that Peters "Shorts" are also superior for other uses. Remember, only in Peters cartridges, "Shorts" included, can the wonderful Semi-Smokeless powder be obtained. In all Peters Rim Fire cartridges the priming mixture is non-corrosive and non-erosive.

See page 18 for additional information.

PETERS .22 L. R. TACK-HOLE CARTRIDGES

Tack-Hole cartridges are specially made for the small bore shooter who desires unusually close, accurate grouping of his shots. Their extremely accurate and uniform shooting qualities have made them the favorite of many of the greatest marksmen in the World.

Every year in the small bore matches, users of "Tack-Hole" cartridges not only win many of the championships but in doing so, they establish records heretofore unheard of.

"Tack-Hole" ammunition scores exactly where the shooter holds. Not only is "Tack-Hole" remarkably accurate in its shooting, but it is also extremely clean shooting, and easy on the rifle barrel. Loaded with Semi-Smokeless powder, which has proven to be superior to powders used by others, in cleanliness, accuracy and uniformity, the shooter can fire his rifle hundreds of times without cleaning and still not interfere with the accuracy. Where a rifle is to be set aside for any length of time, it should be properly cleaned and oiled to avoid action of ordinary atmospheric conditions.

As in all Peters "Rim-Fire" cartridges, the priming mixture used in "Tack-Hole" ammunition is non-corrosive and non-erosive, so here again, users of the  brand have a distinct advantage.

(For further description and prices see page 20.)

PISTOL AND REVOLVER CARTRIDGES

The same great care and exacting requirements are insisted upon with regard to pistol and revolver sizes as in the case of all other Peters cartridges. In cartridges where other manufacturers load ordinary Black powder Peters supply the superior Semi-Smokeless powder.

In all sizes running from the small .22's to the .45's Peters Pistol and Revolver cartridges, whether Semi-Smokeless or Smokeless, assure their users of maximum results.

Police Departments all over the country are fast coming to the  Brand because of its proven dependability, accuracy and all around superiority.

In the United States Revolver Association matches, Peters pistol and revolver sizes always land the big share of the wins. "Where quality counts—they win".

HIGH VELOCITY

EXPANDING POINT

.25-20 WIN. and .32 WIN. (.32-20)

HIGH VELOCITY EXPANDING CARTRIDGES

For small, fast moving game these speedy cartridges with their improved expanding bullets are unequalled. Not only do they increase the range—lower the trajectory, but the uniform mushrooming qualities of the bullet combined with the high speed, results in a “whale of a punch”, really surprising for a bullet of such weight. The .25-20 High Velocity Expanding cartridge is supplied with a 60 grain bullet and has a velocity of 2200 ft. per second with a muzzle energy of 645 ft. lbs., with trajectories at 100 yards 1.3 inches, 200 yards 8.2 inches, at mid-range.

The .32-20 High Velocity Expanding cartridge with a bullet weight of 80 grains has a muzzle velocity of 2000 ft. per second with a muzzle energy of 710 foot pounds, with trajectories of 1.4 inches for 100 yards and 7.6 inches for 200 yards at mid-range. With these ballistics and the superior type of expanding bullet, users are assured of maximum shocking power. See (pages 26 and 30.)

.25 REM. .25-35 AND .30-30

(HIGH VELOCITY)

Here again Peters maintains its leadership from the standpoint of improvements. Without reducing the bullet weight these popular cartridges have been speeded up, thus giving users of the P brand a distinct advantage from the standpoint of increased range, lower trajectory and greater shocking power, hence greater game-getting possibilities.

In cartridges designed for Big Game, if bullet weight is reduced to increase velocity, it follows that a certain amount of striking energy or shocking power will be sacrificed. In these Peters cartridges the standard bullet weights of 117 grs. for the .25 Rem. and .25-35, and 170 grs. for the .30-30 have been retained, although velocities have been increased, hence users are assured of really superior results, when compared with similar other cartridges on the market, where velocities have been increased at the sacrifice of bullet weight. In these Peters cartridges bullet weight is not reduced, although velocities have been increased.

(See pages 42, 43 and 86 for further information.)

ANOTHER PETERS DEVELOPMENT IN GAME CARTRIDGES

NEW TYPE EXPANDING BULLET WITH HIGHER VELOCITY AND INCREASED SHOCKING POWER in .30-30 and .30 Rem.

Recent developments by The Peters Cartridge Company in the .30-30 and .30 Rem. cartridges provide a new improved type of expanding bullet (non-fouling), in two weights, driven at a velocity that is not only superior to similar other cartridges on the market, but which also makes possible greater all-around effectiveness for successful game-shooting.

These popular additions to the **P** line, because of their superior speed and new expanding bullet—which mushrooms perfectly on impact but which holds together well, insuring extreme penetration—increase the range, lower the trajectory, and develop terrific shocking power, the combination of which means greater chances of getting the game.

The new .30-30 cartridge—termed .30-30 M. C. Hollow Point Expanding, supplied in bullet weight of 125 grains, develops a velocity at the muzzle of 2,550 feet per second; muzzle energy 1,803 foot pounds.* Supplied in 165-grain bullet, muzzle velocity 2,250 f. s.; muzzle energy, 1,860 ft. lbs. The new .30 Rem. cartridge supplied with the improved M. C. Hollow Point Expanding bullet of 125-grain weight develops a muzzle velocity of 2,450 f. s.; muzzle energy, 1,665 ft. lbs. The 165-grain weight has a muzzle velocity of 2,250 f. s.; muzzle energy, 1,860 ft. lbs.

With the above new cartridges added to Peters regular .30-30 line with the standard bullet weights but having a velocity superior to similar other cartridges, the **P** line of the popular .30 caliber sizes is not only complete to answer any and every requirement but also superior from every standpoint of the shooter.

Actual Reproduction
of Mushroomed Bullet

*See page 86 for complete ballistic information.

See pages 43 and 44 for list prices and other information.

PROTECTED POINT EXPANDING BULLET

(Patented)

The demand of Big Game hunters for a bullet that combines penetration and mushrooming or expanding qualities, is fully met in Peters Protected Point Expanding Bullet (patented).

Note the cross-section view above. The tip (A) over the point prevents deformation in the magazine. On impact, the air in the chamber of the tip (B) is compressed, causing the instantaneous expansion of the jacket (C), which deforms the whole bullet, resulting in maximum shocking power. So that the bullet will retain its penetrating force, a cup (D) is placed over the end of the slug (E). This cup prevents the slug from breaking up.

As stated, the outstanding feature of the Protected Point Expanding Bullet is, that on impact it mushrooms perfectly, at the same time does not break up, consequently its penetrating powers are at a maximum. Most of the existing Big Game bullets do not deliver maximum shocking power, due to the fact that on impact, they frequently break up into pieces, and often in striking bone or hard tissue, do not have sufficient penetrating qualities to produce desired results. It has also been found in many cases that the ordinary Soft Nose bullet does not mushroom properly, especially when driven at the higher velocities.

We believe, that the Protected Point Expanding Bullet is the most effective Big Game bullet ever produced, and tests which we have conducted, and reports which we have received from experienced hunters, prove this bullet to be in a class by itself. Not only does the bullet develop maximum shocking power, but its remarkable accuracy assures longer, cleaner kills. As in the case of other Peters Military and Sporting bullets, the Protected Point Expanding type is constructed with Peters no-foul metal jacket.

As indicated on pages 42, 43, 44 and 45, we are supplying the Protected Point Expanding Bullet in the .30 Gov't '06, .30-40 Krag, .300 Savage, .270 Win., and .250-3000 Savage.

RIM FIRE CARTRIDGES

.22 B. B. CAP, ROUND BALL

Adapted to Flobert and all .22 calibre rim fire single shot rifles.

Smokeless powder, per 1,000.....	\$ 3.50
Weight of bullet, 20 grains.	
Packed 100 in a box, 10M in a case.	

.22 C. B. CAP

Adapted to Flobert and all .22 caliber rim fire single shot rifles.

Semi-Smokeless powder, per 1,000.....	\$ 4.40
Smokeless powder, lubricated, per 1,000.....	4.40
Smokeless powder, non-lubricated, per 1,000.....	4.40
Weight of bullet, 30 grains.	
Packed 100 in a box, 10M in a case.	

.22 SHORT

.22 SHORT HOLLOW POINT

Adapted to Winchester, Remington, Remington Auto Loading Mod. 24, and Colt Repeating rifles; Stevens, Remington and other single shot rifles; also pistols and revolvers of this caliber. Unequaled for shooting gallery use.

Semi-Smokeless powder, per 1,000.....	\$ 5.00
Smokeless powder, lubricated, per 1,000.....	5.35
Smokeless powder, non-lubricated, per 1,000.....	5.35
Hollow Point, Semi-Smokeless powder, per 1,000.....	5.50
Hollow Point, Smokeless powder, lubricated, per 1,000.....	5.75
Hollow Point, Smokeless powder, non-lubricated, per 1,000.....	5.75
Weight of bullet, 30 grains.	
Packed 50 in a box, 10M in a case.	

Prices quoted in this catalogue are List Prices. Dealers supply Peters Ammunition at regular retail prices.

RIM FIRE CARTRIDGES

.22 LONG

.22 LONG HOLLOW POINT

Adapted to Winchester, Remington, Colt and Marlin Repeating rifles; Stevens, Remington and other single shot rifles and pistols of this caliber.

Semi-Smokeless powder, per 1,000.....	\$ 6.00
Smokeless powder, lubricated bullet, per 1,000.....	7.50
Smokeless powder, non-lubricated bullet, per 1,000.....	7.50
Hollow Point, Semi-Smokeless powder, per 1,000.....	6.50
Hollow Point, Smokeless powder, lubricated bullet, per 1,000.....	8.00
Hollow Point, Smokeless powder, non-lubricated, per 1,000.....	8.00

Weight of bullet, 30 grains.

Packed 50 in a box, 10M in a case.

.22 LONG RIFLE

.22 LONG RIFLE HOLLOW POINT

Adapted to Marlin, Winchester, Remington Auto Loading Mod. 24, and Savage Repeating rifles; Remington, B. S. A., Savage, Stevens, Winchester, Iver-Johnson, and other single shot rifles; Colt, S. & W. and other revolvers; Colt Automatic, Reising, and other automatic pistols.

Smokeless powder, lubricated, per 1,000.....	\$ 8.75
Smokeless powder, non-lubricated, per 1,000.....	8.75
Hollow Point, Smokeless, lubricated, per 1,000.....	9.35
Hollow Point, Smokeless, non-lubricated, per 1,000.....	9.35

Weight of bullet, 40 grains; Hollow Point, 38 grains.

Packed 50 in a box, 10M in a case.

.22 LONG RIFLE (N. R. A.)

.22 LONG RIFLE (N. R. A.) HOLLOW POINT

Adapted to Winchester, Marlin, Remington Auto Loading Mod. 24, and Savage Repeating rifles; Remington, B. S. A., Savage, Stevens, Winchester, Iver-Johnson, and other single shot rifles; Colt, S. & W. and other revolvers; Colt Automatic, Reising and other automatic pistols.

Semi-Smokeless powder, per 1,000.....	\$ 7.00
Hollow Point, Semi-Smokeless, per 1,000.....	7.60

Weight of bullet, 40 grains; Hollow Point, 38 grains.

Packed 50 in a box, 10M in a case.

Semi-Smokeless cartridges are regular, and will be sent unless Smokeless are specified.

RIM FIRE CARTRIDGES

.22 LONG RIFLE INDOOR TACK-HOLE

For extreme accurate shooting up to 75 feet. Adapted to Marlin, Winchester, Remington Auto Loading Mod. 24 and Savage Repeating rifles; Remington, B. S. A., Savage, Stevens, Winchester, Iver-Johnson and other single shot rifles. This cartridge is not designed for use in pistols or revolvers.

Semi-Smokeless powder, per 1,000.....\$ 8.75

Weight of bullet, 40 grains.

Packed 50 in a box, 10M in a case.

.22 LONG RIFLE OUTDOOR TACK-HOLE

For extreme accurate shooting up to 250 yards. Adapted to Winchester, Marlin, Remington Auto Loading Mod. 24 and Savage Repeating rifles; Remington, B. S. A., Savage, Stevens, Winchester, Iver-Johnson and other single shot rifles; Colt, S. & W. and other revolvers; Colt Automatic, Reising and other automatic pistols.

Semi-Smokeless powder, per 1,000.....\$ 8.75

Weight of bullet, 40 grains.

Packed 50 in a box, 10M in a case.

.22 EXTRA LONG

Adapted to old Remington, Ballard, Stevens, Wesson, and other single shot rifles; also S. & W. revolvers.

Semi-Smokeless powder, per 1,000.....\$10.50

Weight of bullet, 40 grains.

Packed 50 in a box, 10M in a case.

Semi-Smokeless cartridges are regular, and will be sent unless Smokeless are specified.

RIM FIRE CARTRIDGES

.22 WINCHESTER R. F.

Adapted to Winchester Model 1890 and Remington Model 12 Hammerless Repeating rifles; Remington, Winchester, Stevens single shot rifles; also Colt target revolvers.

Semi-Smokeless powder, per 1,000.....	\$10.50
Smokeless powder, lubricated bullet, per 1,000.....	11.75
Smokeless powder, non-lubricated, per 1,000.....	11.75
Weight of bullet, 46 grains.	
Hollow Point, Semi-Smokeless powder, per 1,000.....	11.00
Hollow Point, Smokeless powder, lubricated, per 1,000.....	12.25
Weight of bullet, 44 grains.	
Packed 50 in a box, 5M in a case.	

.22 WINCHESTER R. F. HOLLOW POINT

.22 WINCHESTER AUTOMATIC

Adapted to Winchester Automatic Rifle, Model 1903.

Smokeless powder, per 1,000.....	\$11.75
Weight of bullet, 45 grains.	
Hollow Point, Smokeless powder, per 1,000.....	12.25
Weight of bullet, 44 grains.	
Packed 50 in a box, 5M in a case.	

.22 WINCHESTER AUTO. HOLLOW POINT

.22 REMINGTON AUTO. LOADING

Adapted to Remington Auto Loading Rifles, Model 16.

Smokeless powder, per 1,000.....	\$11.75
Weight of bullet, 47 grains.	
Hollow Point, Smokeless powder, per 1,000.....	12.25
Weight of bullet, 45 grains.	
Packed 50 in a box, 5M in a case.	
Semi-Smokeless cartridges are regular, and will be sent unless Smokeless are specified.	

.22 REMINGTON AUTO. LOADING HOLLOW POINT

RIM FIRE CARTRIDGES

.25 SHORT STEVENS

Adapted to Winchester, Remington and Marlin single shot rifles.

Semi-Smokeless, per 1,000.....\$11.75
Weight of bullet, 68 grains.
Packed 50 in a box, 4M in a case.

.25 STEVENS

.25 STEVENS HOLLOW POINT

Adapted to Stevens, Marlin, Remington and Winchester single shot rifles; also Stevens Model 80, and Marlin Repeating rifles.

Semi-Smokeless powder, per 1,000.....\$16.50
Weight of bullet, 68 grains.
Hollow Point, Semi-Smokeless powder, per 1,000..... 17.00
Weight of bullet, 65 grains.
Packed 50 in a box, 2M in a case.

.32 EXTRA SHORT

Adapted to Remington and Protector Repeating pistols. Can also be used in .32 caliber Rim Fire arms.

Semi-Smokeless powder, per 1,000.....\$11.75
Weight of bullet, 55 grains.
Packed 50 in a box, 5M in a case.

RIM FIRE CARTRIDGES

.32 SHORT

Adapted to Winchester, Remington, Ballard, Wesson, Whitney, Stevens, Forehand and Wadsworth, and other single shot rifles; Marlin Repeating rifles, Model 1892; Colt and other revolvers and single shot pistols; also rifle canes.

Semi-Smokeless powder, per 1,000.....\$11.75

Weight of bullet, 82 grains.

Packed 50 in a box, 5M in a case.

.32 LONG

Adapted to Winchester, Remington, Ballard, Wesson, Whitney, Stevens, Forehand and Wadsworth, and other single shot rifles; Marlin Repeating rifles, Model 1892; Colt and other revolvers and single shot pistols; also rifle canes.

Semi-Smokeless powder, per 1,000.....\$13.50

Weight of bullet, 90 grains.

Packed 50 in a box, 5M in a case.

.38 SHORT

Adapted to Remington, Ballard, Forehand and Wadsworth, Wesson and other rifles; also revolvers of this caliber.

Semi-Smokeless powder, per 1,000.....\$18.75

Weight of bullet, 125 grains.

Packed 50 in a box, 3M in a case.

RIM FIRE CARTRIDGES

.41 SHORT

Adapted to National, Williamson, Colt, Remington, Southern Derringer, Forehand and Wadsworth, and other pistols.

Semi-Smokeless powder, per 1,000.....\$17.50

Weight of bullet, 130 grains.

Packed 50 in a box, 3M in a case.

.41 SWISS

Adapted to Swiss, Vetterli and other rifles.

Smokeless powder, per 1,000.....\$57.00

Weight of bullet, 300 grains.

Packed 20 in a box, 1M in a case.

CENTER FIRE CARTRIDGES

PISTOL, REVOLVER AND RIFLE

5.5 m/m VELO DOG

Adapted to Velo Dog revolvers.

Smokeless powder, metal case bullet, per 1,000.....	\$26.25
Primer, Peters No. 1½. Weight of bullet, 45 grains.	
Packed 25 in a box, 2M in a case.	

.22 WINCHESTER CENTER FIRE

Adapted to Winchester, Stevens, Remington and other single shot rifles.

Semi-Smokeless powder, per 1,000.....	\$26.25
Smokeless powder, lead bullet, per 1,000.....	29.75
Primer, Peters No. 1. Weight of bullet, 46 grains.	
Packed 50 in a box, 2M in a case.	

.25-20 WINCHESTER AND MARLIN

Adapted to Winchester Model '92, Marlin Models 1894 and 27, Savage Model 23-B, and Remington Model 25 repeating rifles.

Semi-Smokeless powder, lead bullet, per 1,000.....	\$28.00
Smokeless powder, lead bullet, per 1,000.....	33.25
Smokeless powder, metal case bullet, per 1,000.....	35.00
Smokeless powder, soft point bullet, per 1,000.....	35.00

AMMUNITION ENCYCLOPEDIA

Brief explanation of a few terms commonly used in connection with Ammunition and Fire Arms:

-A-

ACTION: The mechanism of a rifle, particularly the part that is employed in operating the rifle, i. e., loading and firing the rifle.

ALLOY: A mixture of metals. The term commonly used by riflemen to express the mixture of various metals with lead for bullets. The mixing of metals by fusing.

ANTIMONY: Used to alloy lead in bullets for hardening the projectile.

ANVIL: A small piece of metal, arrow-head in shape, which is placed inside the primer cup and which forms the point of resistance as the firing pin strikes the primer, thereby creating a friction which discharges the priming composition.

-B-

BALLING OF SHOT: Fusing of pellets caused by inferior wadding permitting powder gases to escape around the wads and thereby enter into the shot charge. Peters **FELT** wads embody the qualities which control the expanding powder gases resulting in maximum efficiency of the load.

BALLISTIC: The science of projection or projectiles.

BATTERY CUP: A small cup which contains the primer. In Peters shells the inner part of the cup is upset or spread out over the base wad which completely rivets all components of the head into a solid compact construction, all of which is gas tight and which makes it impossible for the base wad to be drawn out into the barrel of the gun due to suction caused by the travel of the load, (hence Peters "Rivet Battery Cup".)

BEVEL CRIMP: A type of crimp originated and perfected by Peters for shot gun shells which assures smooth working of the shell in all types of guns. Although used by others in some form or another, Peters crimp is still in a class by itself.

BLACKING THE SIGHT: To blacken the sight by painting or smoking. Gum camphor is commonly used for this purpose.

BORE: Synonymous to gauge. The diameter of the gun barrel.

BREECH: The rear extremity of the rifle.

BULGING: The swelling of a gun barrel caused by an obstruction in the barrel.

BULLET—Cannelured Bullet: An elongated bullet with grooves around the bullet. These grooves are for holding lubricant or for crimping purposes.

Elongated Bullet: Longer than it is wide, the opposite type from the round bullet.

Flat Pointed: Flat nosed. One with a flat nose.

Hollow Point Bullet: One with a hollow point for the purpose of increasing the mushrooming effect upon impact.

Metal Cased Bullet: One with a jacket of metal which completely encases the nose.

Metal Bullet Point: Bullet having lead bearing and metal tip.

Soft Point Bullet: A metal cased bullet with a tip of lead, so that on impact the bullet will mushroom, thereby increasing the striking energy.

Protected Point Expanding Bullet (patented): A type of Big Game bullet obtained only in Peters cartridges, which delivers maximum shocking power through a combination of perfect expansion or mushrooming and extreme penetration. (See page 17.)

BARREL TIME: Measured from the fall of the hammer to the muzzle of the gun.

-C-

CALIBER OF A RIFLE: A term synonymous to gauge (diameter of bore measured in one hundredths of an inch).

CHAMBER: The rear end of a barrel which receives the shell or cartridge.

CHILLED SHOT: Refers to hard shot. Hard shot is produced through mixing of antimony with the lead.

CHOKE: The decreased diameter of a shot gun barrel toward the muzzle. For the purpose of regulating the spread or pattern of the shot.

COMBUSTION: Burning of the powder in the barrel.

CONE: The reduction of diameter which in a barrel joins the chamber to the bore.

CORROSION: The deterioration on the inside of the barrel caused by the chemical action of the products of combustion after firing, usually caused by neglect.

CRIMP: Crimped—Crimping: A mechanical operation employed in loading metallic cartridges, which consists in turning over slightly or compressing the mouth of the metallic shell, or case, for the purpose of holding the bullet securely in its place. Applied also to shot shells. (See page 88, "Bevel Crimp".)

-D-

DROP: As applied to a gun stock—it means downward bend.

DROP SHOT: Soft shot.

-E-

ENERGY: The force or power of a charge.

EROSION: The actual wear on the inside of a barrel produced by the flame and gases of the ignited powder.

EXTRACTOR: The part of gun mechanism that withdraws the shell or cartridge from the chamber.

EJECTOR: Mechanism which throws the fired shell or cartridge from the arm.

-F-

FULMINATE: One of the ingredients of the priming mixture.

-G-

GALLERY LOAD: A light or reduced charge in cartridges for use indoors.

GAUGE: Diameter of the gun barrel. "12 Ga.", for instance, means that 12 round lead balls of this diameter weigh one pound; lead balls the size of a 10 ga. gun weigh ten to the pound; a 16 ga. gun, sixteen to the pound, etc.

GROOVES: The cavities inside a rifle barrel, which are usually spiral, and by which a bullet when expanded and forced forward receives a spinning motion giving to it an accurate flight.

-H-

HANGFIRE: Delayed or slow combustion.

-I-

IMPACT: A blow. A bullet striking an object.

-J-

JACKET: A covering for a bullet.

-K-

KEYHOLE: Refers to the shape of the bullet hole in the target resulting from the bullet traveling off its axis.

-L-

LANDS: A rifle barrel is bored to a desired size; the inside of the barrel is then called the surface; the grooves are cut from the surface. The raised spiral surfaces left by this operation are the lands.

LEADING: The term used to designate the presence of lead on the inside of a barrel.

-M-

MACHINE REST: An arrangement to which a rifle is affixed, or rested on to test for accuracy.

MID-RANGE: The distance between short range and long range.

MUSHROOMING: Upsetting or expanding of bullet on impact.

MUZZLE VELOCITY: The velocity of a bullet at the muzzle.

-O-

O'CLOCK: A term used by riflemen to indicate the location of a shot, or the direction from which the wind is blowing. To illustrate: Face the target with watch in hand and with the back of watch toward target. A shot in the line of figure XII would be a 12 o'clock shot; in the line of III, a 3 o'clock shot; in the line of VI, a six o'clock shot, etc.

-P-

PATTERN: Refers to the distribution of the shot charge after leaving the muzzle.

PERCENTAGE OF PATTERN: Number of pellet marks in a thirty inch circle, over a forty yard range, divided by the number of pellets in the load.

POWDER CHARGE: The amount of powder used in a load.

POWDERS: The powders used in loading are of three types: Black, Semi-Smokeless and Smokeless. Although black powder is still loaded by some companies, it has been antiquated by Semi-Smokeless—a remarkable powder, obtainable only in Peters ammunition. Semi-Smokeless is neither a smokeless nor a black powder nor a mixture of the two, but contains the admitted good qualities of both. Conspicuous among its merits may be mentioned these: high velocity with superior accuracy—absence of fouling—greatly lessened heat and less smoke than black powder. Smokeless powders are divided into two types. The first is known as Bulk, meaning its charge corresponds, or nearly so, in bulk to the charge of black powder; the second is the Dense type, which means a denser or much less in bulk.

PRIMER: A metallic cup charged with a priming composition; a blow from a hammer or plunger striking the primer ignites the powder charge.

-R-

RECOIL: The backward movement of a gun in the act of discharge.

REENTRY: Entering again; a term usually connected with reentry matches.

RICOCHET: **RICOCHET SHOT:** A glancing shot.

RIM-FIRE: A term applied to a cartridge fired by a blow on the rim of the head of a cartridge. Rim-fire rifle or pistol, one that fires a rim-fire cartridge.

RIVET BATTERY CUP: See Battery cup.

ROLLING A RIFLE: Rolling the rifle to one side or the other while aiming; not holding it plumb, the result of which is to send the shots in the direction in which the rifle is rolled. Same as canting a rifle.

-S-

SEMI-SMOKELESS POWDER: See Powders.

SHOCKING POWER: The force delivered by the projectile on impact; the result brought about through combination of striking energy and penetration.

SHOOT-OFF: A term generally used to mean the settlement of a tie by firing more shots to further test skill or decide supremacy.

SIGHTING SHOT: Shots fired to learn if the sights are correct, or learn the elevations, windage, or drift.

SPREADER LOAD: A Peters shot gun load which spreads its pattern over short ranges; used in bushy sections. (Peters Spreader Load, see page 104.)

SQUIB: SQUIB LOAD: A defective load. An extremely weak sounding load.

"STEEL WHERE STEEL BELONGS": A steel cup inside the brass cup which covers the entire head and rim of Peters H. V. and Target shells—added protection to the shooter which prevents bursted rims, blow-backs, gas leaks, etc.—an idea originated and developed by The Peters Cartridge Company.

STRIKING ENERGY: The force of the impact measured in foot pounds.

-T-

TACK-HOLE: The exact center of a bulls-eye—sometimes a small spot in the center of a bulls-eye, to which this term is also applied. Peters .22 Long Rifle "Tack-Hole" cartridges derive their name from this term because of their remarkable accuracy and uniformity. (See pages 14 and 20.)

TAKE DOWN SYSTEM: or TAKE DOWN RIFLE: An arm, the barrel of which can readily be taken from the action; employed for securing compactness in carrying the arm.

TRAJECTORY: As applied to bullets, the curve a bullet describes in its flight.

TRIGGER PULL: The amount of pressure necessary to release the trigger. Riflemen refer to this as a one-pound pull, or two pound pull, i. e., requiring a pressure of one or two pounds to release the trigger. A hair trigger pull; a very light pull; a creeping pull; a dragging pull; a still pull; a hard pull; a smooth pull; a fine pull, etc.

-U-

UNCRIMPED: Ammunition that is not crimped (See Crimp.)

-V-

VELOCITY: The speed of a projectile in its flight.

-W-

WAD: A yielding substance usually of felt, placed over the powder of a shot shell for the purpose of controlling gas blast. (See page 121.)

WINDAGE: The allowance made for drift of a bullet.

WOBBLE: A term applied to the unsteady rotation or spin of a bullet; usually caused by insufficient twist in the rifle barrel.

PETERS SHOT GUN SHELLS

The **P** line of shotgun shells consists of four outstanding brands, namely, High Velocity, Target, Victor and Referee. The High Velocity shell is especially designed to give ballistic results beyond those obtained with the regular standard maximum load. The High Velocity shell has justly earned a national reputation among shooters as a superior long range shell because it is the only shell on the market especially designed for the use of progressive burning powder and this combined with Peters method of loading, develops the greatest efficiency of this type of powder. The Target shell is designed to handle the regular bulk or dense smokeless powders supplied in standard loads. For field or trap use the Target shell represents to the highest degree shot shell perfection.

Peters Victor shell was designed to meet the demand of shooters for a more popular priced smokeless shell and although low in price, the Victor is not only a Peters quality shell as regards materials, construction and load, but also has proved to be extremely effective in all shooting where the light and medium load combinations are sufficient.

The Referee shell meets in a really superior manner the existing demand for Black powder shells. The Referee is loaded with Semi-Smokeless powder which has proven to be superior to black powder in every way, but in spite of this fact, the Referee sells at the same price as black powder loads.

SHOT SHELL MANUFACTURING

Empty paper shot shells consist of the paper tube, base wad, steel reinforce ("steel where steel belongs"), brass head, battery cup and primer. The paper tube is made from paper especially manufactured for this purpose, under our direct supervision and in accordance with our own specifications, being rolled on machines designed and built by The Peters Cartridge Company.

The base wad is made from special paper manufactured under our own specifications. This "cushions" the blow of the explosion and in connection with the steel reinforcement, offers the necessary resistance to the powder gas at the base of the shell.

The steel reinforce ("steel where steel belongs") is used to reinforce the head of the shell, serving as additional protection where maximum loads are used, and is original with The Peters Cartridge Company.

In the "Heading" operation, the paper tube, brass cup and battery cup, base wad and steel reinforcement are assembled and headed to give the proper rim diameter and thickness and the proper compression and shape to the base wad. Likewise an important object of this operation is to so join the paper tube and brass head together that separation is impossible when the shell is used in the gun. By looking at a cross section of Peters shell head construction, it will be noted how the base wad and paper tube are forced into the rim formed by the brass cup and steel reinforcement and headed under great pressure, which holds the tube to the head and with the upsetting or rivetting of the battery cup, performed in this same operation, all components of the head are securely locked together, assuring against dislodged base wads, faulty extraction or tube separation.

The priming is done on special presses of unusual accuracy, and this operation completes the manufacture of the empty paper shells which are now sent to machines for loading, this to be fully described shortly.

An operation in the making of Peters Famous Felt Wadding. Showing a huge roll of felt being dried just previous to being cut up into sheets, pressed and lined. Felt of high quality has proven to be the most desirable wadding for shot shells, and careful examination will disclose that Peters felt wadding embodies these necessary qualities to a very superior degree—all because we make our felt in our own plant, and thus can insist upon and get felt of the desired quality.

In the manufacture of elastic felt suitable for wadding in Peters shells, cattle hair of long, staple and special quality only is used. As in the case of all raw materials entering into the manufacture of Peters ammunition, the hair for this felt must measure up to Peters specifications, otherwise it will not be accepted for use.

The first operation in the manufacture of felt removes all foreign matter and dirt from the hair. The clean hair is then run through a machine which transforms it into filmy layers, several of which go to make up felt of the desired thickness.

The layers of hair are formed into rolls and then taken to the "Hardeners" where they are properly felted; they then pass through a machine and given a special treatment, developed by Peters, which greatly assists in giving the felt the quality of firmness and elasticity, so essential to good shot shell wadding. Operations too lengthy to describe here, requiring the greatest of care, are necessary in order to secure felt of an even thickness and density, all of which can be done correctly only by men of judgment and of long experience with Peters requirements. The felt is next cut into the desired length and pressed smooth preparatory to being lined on both sides with paper especially manufactured for this purpose. The lined sheets of felt are then subjected to a heat treatment and placed under pressure in automatic presses, it being extremely important in this operation that the proper pressure and timing of same be obtained in order to secure necessary results.

*View in the boiler room of Peters huge power-house.
Here steam is generated which provides the power and heat for the
buildings and drying rooms of the Peters plant.*

After passing through the cutting operation, the strips are passed to the wad-cutting machines. We now have a clean, elastic wad of even thickness, uniform size and density. In the next and last operation, the wads are passed through the greasing machines where a thin film of specially prepared lubricant is placed all around the edges, after which they are complete and ready for loading.

It will be noted that the felt wads made by the Peters method are entirely free from dirt and all foreign matter, and are of the proper elasticity and density, this being one of the main reasons for the superior ballistics obtained in all Peters loads.

The shot tower at the Peters plant is the latest and most modern structure of its kind in the country, and because of this fact Peters shot is of superior character, for in the building of this tower experiences of others were carefully analyzed, with the result that when completed it embodied the latest improvements and methods in the manufacture of shot.

The Peters shot tower is a concrete and brick structure of fourteen stories, and practically automatic from top to bottom. After the pig lead is heated to a molten state, the shot pellets are formed and dropped the full height of the tower into water to prevent mutilation. They are dried and run over a series of tables so designed and

Sorting Screens in Shot Tower—Here the round shot pellets are sorted as to size. This operation is extremely accurate in the results obtained—the reason why Peters shot of a given size are absolutely uniform.

operated as to remove all imperfect shot. Then each specific size is automatically separated, polished, and placed in the proper storage bin. The shot thus obtained are perfectly round, uniform in size and temper, highly polished and of superior quality.

Peters shells are loaded on automatic machines designed, perfected and used exclusively by Peters, which are almost human in their operations.

The powder charge is determined for any desired load and ingenious devices are provided on this machine to positively assure only correct loads passing through.

The ramming of the powder, wads and shot is performed by weighted rammers, insuring equal and uniform pressure on every load, this method being very much superior to that of a fixed rammer, which could not fail to give unequal pressures should there be any variations in the shot or in the thickness or density of the various wads. Peters shells have for years been loaded to uniform standards of velocity, pattern and penetration, and these are standards established by Peters. All bulk powders, irrespective of brand, are loaded to give the same ballistic results, load for load. All dense powders of equal specifications regardless of brand, are loaded not only to give relatively the same ballistics, but to give the same as the corresponding bulk powder load. This results in "Uniformity" to the highest degree.

The firm watertite, smooth-working, "bevel crimp" which is appreciated by all users of Peters shells, is the result of many years of study and development and is responsible for the perfect functioning of Peters shells in all kinds of arms and under all shooting conditions.

*Scene in section of Ballistic Department—In this room Peters shells and cartridges are tested for functioning in the various arms and for casualties. Firearms of every make and description are found in a room adjacent, giving this department the facilities for subjecting the **P** Brand ammunition to the most practical and exhaustive tests.*

The Ballistic Department is one of the most important in the plant, for it is here that goods in process and finished products are tested for the various qualities insisted upon by Peters. Instruments of the latest and most sensitive character keep a close check on all goods going through the plant, with the result that nothing is allowed to be shipped but what is as near perfect as is possible for man and science to make it.

Primers are tested by this Department for sensitiveness and ignition. All primers must fire within the limit of a pre-determined maximum blow, which has been decided as safely assuring the proper functioning of the primer in the gun. There is also a minimum blow determined, under which no primer should explode. This is to assure against over-sensitiveness.

The strength and heat of the primer flash and its adaptability to the various characters of powder, is determined by ignition tests. Ignition time is obtained by recording the time of the travel of the load from the fall of the hammer to the muzzle.

When the primers are approved for sensitiveness and ignition, they are then assembled in the shells. During this operation, the primed shells are being constantly tested by drop test and must fire within the limits of the maximum blows that have been determined.

INSPECTION TABLE—One of the many inspections which Peters Cartridges must pass before being approved for shipment.

Shot shells and cartridges are constantly selected at random from the different machines and taken to the Ballistic Department for testing; the shot shells are tested for functioning, velocities, pressures and patterns. Metallic cartridges are tested for functioning in the various rifles for velocity, pressure, energy and penetration. These tests are made constantly throughout the day. Thousands of shells and cartridges are fired and tested daily in the Ballistic Department, all for the purpose of maintaining an absolute Quality product.

We now have the completed product and one can see, to a certain extent, what a complicated yet interesting problem the manufacture of Small Arms ammunition is, especially where Quality is the first consideration. There is absolutely no guess work, every detail and every operation must be given the most careful attention by workmen of unusual experience. The Peters Inspection Force functions along the lines of an efficient Police Force—each member has his own particular “beat” to cover, he is entirely responsible for the character of goods which that “beat” produces. This Inspection Force knows Peters requirements and is held responsible for the quality of the product from the time the raw materials are received until the finished cartridges and shells are packed into the cases, ready for shipment. Peters standards are strictly maintained at all times, regardless of cost.

Such is the story of the manufacture of Peters “Quality Ammunition”. It is plain to be seen nothing is left undone and no effort considered too great in our desire to place in the hands of discerning shooters loads that will not only produce superior results, which will do full justice to the users ability, but which are a credit to the manufacturer producing same.

THE PETERS CARTRIDGE COMPANY

LOADED SHOT GUN SHELLS

"HIGH VELOCITY" (H. V.)

"steel where steel belongs"

No. 3½ Primer

The "High Velocity" is the latest addition to the PETERS line. It is an *especially designed* shell for loads heavier than appear in regular standard list and is furnished only in the load combinations listed. It is what its name indicates—a high velocity, long range and hard hitting load. It is loaded with progressive burning smokeless powder, and is the only shell on the market especially designed and manufactured for extreme high velocity long range shooting. It should be used only in guns in good condition, intended for maximum loads.

In ordering, give load number, size of shot and specify "High Velocity."

The final figure of the load number indicates the size of shot and may be varied according to the size desired. Thus 0122 ch. means 12 ga., 2 ch.; 0127 ch., means 12 ga., 7 ch.

"In telegraphing, give cipher word, name of powder and size of shot."

LOADED SHOT GUN SHELLS

"TARGET"

(Reg. U. S. Pat. Off.)

"steel where steel belongs"

PETERS No. 3½ PRIMER

Bulk or Dense Smokeless Powders

The "Target" shell is the highest possible grade of smokeless shell supplied in standard load combinations, and will give the shooter the same one hundred per cent quality, as has been heretofore supplied in our "Ideal" and "Premier" shells. The "Target" was formerly loaded only with bulk smokeless powders, but is now supplied loaded with either bulk or dense smokeless, the shell being especially manufactured for the kind of powder with which it is loaded. It has all the Peters superior features, including "steel where steel belongs," rivet battery cup, watertite bevel crimp, uniform and superior waterproofing, elastic hair felt wadding, Peters uniform and perfectly finished shot, and Peters exclusive method of loading. The load is fully branded on the shell, label and case.

All standard brands of American bulk and dense smokeless powders are loaded in the "Target" shell.

The following letters prefixed to load numbers may be used to indicate kind of smokeless powder:

D for DuPont
S for Schultze
N for Ballistite

E for E. C.
DS for Dead Shot
L for Infallible

The final figure of the load number indicates the size of shot, and may be varied according to the size desired. Thus, No. 3104 means 2¾ drs. 1 oz. No. 4 shot; No. 3108, the same load with No. 8 shot; No. 3100, the same load with No. 10 shot, etc.

.410 PAPER SHOT SHELLS

(12 m/m.) (36 Gauge)

PETERS No. 1½ PRIMER

Loaded with Smokeless Powder

Designed to meet a growing demand for a paper shot shell for shooting pests and small animals and game birds. The ideal ammunition for squirrels, rabbits, muskrats and small birds where the larger gauges are not only unnecessary, but too powerful.

These shells are adapted to all standard guns of .410 caliber including Stevens, Marble, H. & R. and others. They have an effective range of 25 to 35 yards and are of the same exceptional high quality as other goods bearing the  brand.

Load No.	Drs. Powder	Ozs. Shot	Size of Shot	List per 1,000 Soft	List per 1,000 Ch.	Lgth. Shell inches	Tele-graphic Cipher

LOADED SHOT GUN SHELLS

"VICTOR"

(Reg. U. S. Pat. Off.)

No. 3½ Primer

Loaded with Smokeless Powder

A smokeless shot shell, embodying the Peters high standard of quality in materials and loading. Supplied with Smokeless powder of American manufacture and loaded on the same identical machines as those used for loading our other shot shells, insuring uniformity both as to powder and shot charges, and also as to pressure exerted upon both powder and wads. The VICTOR is wadded with Peters high quality FELT wads. It has the inimitable Peters smooth working "watertite" bevel crimp and the same perfect shot as in Peters higher priced shells and is primed with Peters No. 3½ primer with the riveted battery cup construction. For the usual field and trapshooting the Victor shell is unsurpassed.

The final figure of the load number indicates the size of shot and may be varied according to the size desired. Thus No. 5106 means 12 ga., 2¾ drams, 1 oz. No. 6 shot No. 5108, the same load with No. 8 shot, etc.

12 GAUGE—2⅝ in.

Series No.	Drs. Pdr.	Ozs. Shot	Sizes Soft Shot	Price Soft Shot Per M	Sizes Chilled Shot	Price Ch. Shot Per M	Tele-graphic Cipher

5730	2¼	⅞	4-5-6-7-8-10....	38.50	4-5-6-7½-9....	41.50	Vigum

*Furnished in 2¾ inch shell length only.

†7½ ch. and 8 ch. furnished in 2¾" length when so specified.

Note—Special loads will not be furnished in Victor shells.

In telegraphing give cipher word and size of shot. When chilled shot is wanted add "ing" to cipher word.

PETERS TRAP LOADS

TARGET

VICTOR

There is not a trapshooting tournament held that Peters shells are not very much in evidence not only as to number of users but also as to the results obtained, in the way of high scores. The superior quality construction and exclusive method of uniform loading assures trap loads that embody to a greater degree all of the important requisites of winning ammunition. Sure fire primer—fast and uniform velocities—evenly distributed patterns—absence of disturbing recoil, and last but not least—absolute dependability. Especially is this dependability desirable when the race is close, when one or two birds will win, when to win requires perfect co-ordination of shooter, gun and ammunition—that's when these superior Peters qualities make themselves manifest and fully appreciated.

The following letters prefixed to load numbers may be used to indicate kind of smokeless powder supplied in the Target shell.

D for DuPont.
S for Schultze.
N for Ballistite.

E for E. C.
DS for Dead Shot.
L for Infallible.

The final figure of the load number indicates the size of shot and may be varied according to the size desired; thus, No. 3127½ ch. means 2¾ drs., 1⅛ oz. No. 7½ Chilled shot; No. 3128 ch. the same load with No. 8 Chilled shot.

MEMORANDA

LOADED SHOT GUN SHELLS

"REFEREE"

(Reg. U. S. Pat. Off.)

No. 2 Primer

Loaded only with Semi-Smokeless Powder

This powder, with slight additional smoke, gives results equal to the best standard smokeless powder, yet the "Referee" is sold at the same price as black powder shells of other makes. Semi-Smokeless is manufactured under letters patent, and cannot be used by any ammunition manufacturer except The Peters Cartridge Company. The "Referee" therefore has no rival in the ammunition market. It has the velocity of the standard smokeless powders; at the same time it has the low breech pressure of black powder, and is as safe to shoot as black.

The "Referee" may be shot indefinitely without cleaning the gun or injuring the barrel. The powder is quick of ignition and absolutely reliable in all climates and under all conditions. It is pleasant to shoot, and is very superior in the field, where long, clean kills are desired.

The wadding is the finest quality of clean felt, manufactured by us for this purpose. It is free from dirt, prevents leading and is an important factor in securing standard velocity and excellent pattern.

Notwithstanding that the "Referee" is vastly superior to black powder shells and equal in many respects to smokeless loads, it is sold at the same price as black powder in other brands of shells.

The final figure of the load number indicates the size of shot, and may be varied according to the size desired. Thus, No. A94 means 3 drs. 1 oz. No. 4 shot; No. A98, the same load with No. 8 shot, etc.

“REFEREE” LOADED SHELLS

------	-----------------	---------------	----------	-------	----------

We have discontinued listing the “LEAGUE” shell, loaded with black powder, but will furnish same when specified, in same combinations and at the same price as the “REFEREE” shell.

“In telegraphing, give cipher word, name of powder and size of shot.”

“REFEREE” SHELLS

Basis for Computing List Price of Special Loads

SEMI-SMOKELESS

Per 1,000

10 gauge, 4 drams, $1\frac{1}{8}$ oz. soft shot.....	\$43.00
12 gauge, 3 drams, 1 oz. soft shot.....	37.00
16 gauge, $2\frac{1}{2}$ drams, $\frac{7}{8}$ oz. soft shot.....	36.25
20 gauge, $2\frac{1}{2}$ drams, $\frac{7}{8}$ oz. soft shot.....	36.25
28 gauge, $1\frac{3}{4}$ drams, $\frac{5}{8}$ oz. soft shot.....	33.50

For “Referee” loads not listed on preceding pages, add to the above basis:

For each $\frac{1}{4}$ dram of powder.....	\$ 0.75
For each $\frac{1}{8}$ oz. of shot.....	1.50
For Chilled Shot add to the above basis.....	13.00
For Buck Shot and lettered sizes add to above basis.....	13.00
For Dust Shot add to the above basis.....	15.75
For Soft Shot add to the above basis.....	10.00

No deduction for powder or shot is made when either one is lighter than given in basis.

Loads not shown in regular list will be supplied only on the above basis.

Orders for loads not listed accepted only in case lots of 500.

MAXIMUM SEMI-SMOKELESS LOADS

	Powder	Shot
*10 gauge.....	5 drs.	$1\frac{1}{4}$ oz.
*12 gauge.....	$3\frac{3}{4}$ drs.	$1\frac{1}{8}$ oz.
*16 gauge.....	3 drs.	1 oz.
20 gauge.....	$2\frac{1}{4}$ drs.	$\frac{7}{8}$ oz.
28 gauge.....	$1\frac{3}{4}$ drs.	$\frac{5}{8}$ oz.

*Not on regular list, see above basis for computing list price.

Note—The above basis applies to Semi-Smokeless only.

All Loaded shells packed 25 in a box; 500 in case.

YACHT GUN SHELLS

Loaded with Black Powder only.

	Per M.
10 gauge 8 drams Black Powder.....	\$41.50
Packed 25 in box; 500 in case.	

LENGTHS OF LOADED SHELLS

For the purpose of securing uniformity in loading and maintaining a high standard of shooting qualities in our shells, we have adopted the following schedule of shell lengths for regular loads:

"REFEREE"

10 gauge.....	2 $\frac{7}{8}$ inch
12 ".....	2 $\frac{5}{8}$ "
16 ".....	2 $\frac{9}{16}$ "
20 ".....	2 $\frac{1}{2}$ "
28 ".....	2 $\frac{1}{2}$ "

"VICTOR"

12 gauge.....	2 $\frac{5}{8}$ - 2 $\frac{3}{4}$ inch
16 ".....	2 $\frac{9}{16}$ "
20 ".....	2 $\frac{1}{2}$ "

"TARGET"

10 gauge.....	2 $\frac{7}{8}$ inch
12 ".....	2 $\frac{5}{8}$ - 2 $\frac{3}{4}$ "
16 ".....	2 $\frac{9}{16}$ "
20 ".....	2 $\frac{1}{2}$ - 2 $\frac{3}{4}$ "

"HIGH VELOCITY"

10 gauge.....	2 $\frac{7}{8}$ inch
12 ".....	2 $\frac{3}{4}$ "
16 ".....	2 $\frac{9}{16}$ "
20 ".....	2 $\frac{3}{4}$ "
.410 ".....	2 $\frac{1}{2}$ "

"SMALL BORE SHELLS"

28 gauge.....	2 $\frac{1}{2}$ inch
.410 ".....	2 "

For price of Shells in lengths not shown in regular list, see "Basis for computing list price of special loads."

In tubes for pocket use. By extending tube, shot can be removed as desired, or poured into barrel.

100 tubes to a case. Gross weight, 30 lbs. Net weight, 25 lbs.

Loose Air Rifle Shot also supplied in 1-lb., 5-lb. and 25-lb. bags.

Prices quoted the trade on application.

GUN WADS

Cut from Best Elastic Felt, Made in Our Own Factories
(Unequaled for Density and Even Thickness.)

The Peters Cartridge Company makes its own felt, for gun wads only, using for this purpose specially selected, washed brown cattle hair and other high grade materials. In a shotgun shell the shot pattern, velocity, freedom from leading and from excessive recoil, all depend in a large measure upon the wadding. Because this is so vital a feature, The Peters Cartridge Company has for years made its own wads, so as to be able to control their quality. Peters wads contain no dirt or foreign material which would injure the barrel of the gun or in any other way be detrimental. Peters wads are so firmly knit together that they will not blow to pieces; they are very elastic, and will contract evenly at the choked muzzle of the gun. Peters wads, because of their perfect confinement of the gases and perfect lubrication, result in a finer shooting shell than is possible with any other make of wad.

BLACK EDGE

3-16 inch Thick. Packed 250 in Box Per M.		1/4 inch Thick. Packed 250 in Box Per M.		3/8 inch Thick. Packed 125 in Box Per M.

410 gauge	1.05	1.05	

All card board wads packed 50,000 to a case. "A" thickness will be shipped when orders do not specify otherwise.

PETERS PRIMERS

Peters Primers are designed especially for the particular shell or cartridge for which they are intended, and are properly adapted to Semi-Smokeless and the different kinds of Smokeless powders with which they are to be used. They are absolutely sure-fire, with a hot, powerful flash, which results in quick, uniform ignition of the powder charge.

	Per M.	Telegraph Cipher

POPULAR LOADS FOR DIFFERENT SHOOTING

The loads suggested below were arrived at through popular demand. We do not mean to imply that any one of these combinations is the only load one can use for the game listed and get good results for there are no doubt other combinations which would prove just as effective, but for the purpose of giving those who may desire such information we list load combinations for various game shooting as determined from actual demand.

Character of Shooting	Shell	Gauge	POWDER			SHOT	
			Bulk Drs.	Dense Grs.	Semi-Smo. Drs.	Ozs.	Size

*Listed in Chilled Shot only.

(a) High Velocity shell is loaded to give a velocity in 12 ga. equivalent to 3 $\frac{3}{4}$ drs. of regular bulk smokeless powder; in 16 ga. equivalent to 3 drs.; 20 ga. equivalent to 2 $\frac{3}{4}$ drs. Where extreme long range—hard hitting results are desired the "High Velocity" shell has no equal.

ADDENDA

All loads listed in this catalog are subject to change.

For domestic trade we adhere to the standard list of loads as recommended by the Division of Simplified Practice, Department of Commerce. For export trade see Export List.

Since this catalog went to press we have added buck shot and single ball loads to the High Velocity shell. For specific data see latest price list booklet.

**THE
PETERS CARTRIDGE
COMPANY**

ADDITIONAL CHANGES SINCE THIS BOOK WENT TO PRESS

.300 Cal. Savage Cartridge with 180 grain metal cased Hollow Point Expanding bullet has been added — list price \$92.00 per 1000.

High Velocity shells will be furnished in either DuPont "Oval" powder or Hercules "Herco" powder.

Schultze and Ballistite powders have been discontinued by the manufacturer. We will furnish subject to stock on hand.

12 gauge Target shells, except Buckshot, Spreader, and Single Ball loads, will be supplied in any standard brand of American smokeless powder and will be so marked. 10, 16, 20, 28 and .410 gauge Target shells, and 12 gauge Target, Buckshot, Spreader, and Single Ball loads will be supplied with standard brands of American smokeless powder, unmarked, the particular brands loaded to be at our option.

List prices of .22 Short smokeless, .22 Long smokeless, .22 Long Rifle smokeless, in both hollow point and solid ball, are reduced to the list price of the same cartridges supplied with Semi-Smokeless powder.

Several metallic cartridges have been discontinued. See latest price list booklet.
